The Bureau of Standards, Metrology and Inspection (BSMI) under the Ministry of Economic Affairs announced today (June 23) that new inspection requirements covering nine product categories will take effect on July 1, 2026. The newly regulated products include electric vehicle charging equipment rated at 30 kW or below, power conversion systems rated at 20 kW or below, stationary lithium energy storage systems with a capacity of 20 kWh or below, lithium battery packs for energy storage with capacities ranging from 1 kWh to 20 kWh, seven

types of rechargeable household appliances such as electric mosquito swatters, and plastic puzzle ground mats.In addition, energy efficiency requirements for automotive tires will be introduced, while inspectionrequirements for Portland cement and wooden board commodities will be revised to further enhance productsafety and quality.

BSMI explained that electric vehicle charging equipment, power conversion systems, stationary lithium energy storage systems, and lithium battery packs for energy storage are increasingly being installed in residential and other environments. At the same time, advances in battery technology have led to the widespread use of rechargeable batteries in household appliances, including electric mosquito swatters. To ensure consumer safety, these products will be brought under mandatory inspection and tested in accordance with national standards harmonized with international standards.The requirements cover key safety aspects such as insulation performance, thermal stability, electromagnetic compatibility (EMC), and flame retardancy. To better protect children's health and reduce exposure to hazardous substances such as phthalates and formamide, plastic puzzle ground mats will also be subject to mandatory inspection requirements. Beginning July 1, 2026, these products must comply with applicable inspection requirements and complete the required conformity assessment procedures before being placed on the market.

In line with global sustainability trends, BSMI is introducing additional energy efficiency requirements for automobile tyres, including rolling sound emission, wet grip braking performance, and rolling resistance coefficient, to enhance energy efficiency and driving comfort. Meanwhile, to promote the reuse of waste materials in cement production and advance circular economy objectives, a chloride ion testing requirement will be included in the inspection requirements for Portland cement to ensure that the introduction of alternative raw materials does not compromise cement quality and stability. Inspection standards and testing methods for wooden board commodities will be revised to improve inspection efficiency.

To safeguard consumer rights and product safety, BSMI will continue to collect and assess safety information on emerging products, require mandatory inspection for products with potential safety concerns, and regularly review and update these requirements. Manufacturers are urged to comply with applicable safety and labeling requirements. Consumers are advised to purchase products bearing the Commodity Inspection Mark and to ensure that relevant electrical equipment is evaluated and installed by qualified electrical contractors designated by the manufacturer.

Details of the newly announced inspection requirements are available on the BSMI website (https://www.bsmi.gov.tw/wSite/mp?mp=2) under News > Regulatory Updates > Announcements of Adoption. For further information, please visit the website or contact BSMI's toll-free service line at 0800-007123.
